

1 <http://cba.unomaha.edu/faculty/mohara/web/LEA-f11-SYSTEMS-handout.pdf>

2
3 *"For every complex problem*
4 *there is an answer that is clear, simple, and wrong."*

5 H. L. Mencken
6

7 *"Any intelligent fool can make things bigger and more complex.*
8 *It takes a touch of genius - and a lot of courage to move in the opposite direction."*

9 Albert Einstein
10

11
12 *"As far as the laws of mathematics refer to reality,*
13 *they are not certain, and as far as they are certain, they do not refer to reality."*

14 Albert Einstein
15

16 *"If people do not believe that mathematics is simple,*
17 *it is only because they do not realize how complicated life is."*

18 John von Neumann
19

20 *"Not everything that counts can be counted,*
21 *and not everything that can be counted counts."*

22 Albert Einstein
23

24
25
26
27 *"Technological progress is like an axe in the hands of a pathological criminal."*

28 Albert Einstein
29

30 *"How did it get so late so soon?"*

31 Dr. Seuss
32

33 *"Imagination is more important than knowledge."*

34 Albert Einstein
35
36
37

38 Many, but far from all, of the items outlined below (most especially outline levels IV.
39 and V.) can be found discussed in:

40 **Hayden, F. Gregory. *Policymaking for a Good Society: The Social Fabric***
41 ***Matrix Approach to Policy Analysis and Program Evaluation. Springer:***
42 **New York, 2006. ISBN-13: 978-0387-29369-1.**
43

- 44 I. All excellent analysis focuses upon **SYSTEMS**.
- 45 A. Profit necessarily requires **at least three systems** ($\pi = TR - TC$).
- 46 B. Ethics always involves **at least a multitude** of systems.
- 47 C. Complex socio-ecological systems necessarily engage
- 48 complex socio-technological systems.
- 49 D. One tool for managing such analysis is the Social Fabric Matrix.¹
- 50
- 51
- 52 II. Systems analysis requires a **paradigm shift**
- 53 away from **isolated transactions** and towards **interrelated processes**.
- 54 A. Point of view is dependent upon a system of beliefs;
- 55 and, the viewer's own system of beliefs
- 56 rarely either is inventoried or is acknowledged by the viewer.
- 57 1. Context.
- 58 An isolated zero sum transaction
- 59 versus a linear flow versus a system (e.g.,² with feedback loops).
- 60 2. Criteria.
- 61 a. What are the (e.g., your) metrics of "good" and of "bad"?
- 62 i. For example,
- 63 does "good" always increase when GDP increases?
- 64 ii. See also II.A.7.: [positivist versus normative].
- 65 b. Systems necessarily have
- 66 competing arrays of explicit goals as well as
- 67 competing arrays of implicit goals.
- 68 c. EXAMPLE: Sustainability.
- 69 i. **Strong sustainability.**
- 70 Infinitely repeatable
- 71 until an exogenous force alters the system.
- 72 [I.] Does not require the assertion,
- 73 but is totally consistent with the assertion, that
- 74 human technology *can not* be
- 75 a sufficiently close substitute
- 76 for natural processes.
- 77 (e.g., baby formula *can not*
- 78 equal mother's breast milk)
- 79

¹ Hayden, F. Gregory. *Policymaking for a Good Society: The Social Fabric Matrix Approach to Policy Analysis and Program Evaluation*. Springer: New York, 2006. ISBN-13: 978-0387-29369-1.

² **NOTE: i.e. means that is whereas e.g. means for example.**

- 80 II. A. 2. c. ii. **Weak sustainability.**
 81 Is repeatability over a short long term
 82 (i.e.,³ *not* as long as an economist's **long run**).
- 83 [I.] Weak sustainability does require the assertion
 84 that human technology can be *at least* a
 85 sufficiently close substitute
 86 for natural processes
 87 (e.g., baby formula *does* equal
 88 mother's breast milk).
- 89 [II.] An economist's **long run** in theory,
 90 is an indeterminate clock time:⁴
 91 it is that period that starts when
 92 fixed costs equal zero.
- 93 [A.] $TC = FC + VC$
 94 (i.e., fixed cost plus variable cost)
- 95 [B.] Recall I.A.: [systems if excellent
 96 analysis] and note II.A.4.b.: [when].
- 97 iii. **Profitable.**
 98 A firm is profitable if, for the period of firm's planning
 99 horizon TR received equals TC paid: $\pi = TR - TC$.
- 100 [I.] Recall that economists define profit in a variety
 101 of ways. Recall specifically that economists
 102 focus on the explicit and the implicit purchase
 103 of four resources (i.e., land, labor, capital, and
 104 entrepreneurial ability) and, respectively, the
 105 four payments for those resources (i.e., rent,
 106 wages, interest, and **normal profit**).
- 107 [II.] To discuss "profitable"
 108 requires specific attention to the following.
- 109 [A.] Whether a mere accounting profit
 110 (i.e., π_A) is obtained?
- 111 [B.] Whether the obtained accounting
 112 bottom line (be that an accounting profit
 113 or an accounting loss) satisfies the
 114 requirements of normal profit (i.e., π_N)?
- 115 [C.] Whether an economic profit
 116 (i.e., $\pi_A > \pi_N$) has been obtained?

³ **NOTE: i.e. means that is whereas e.g. means for example.**

⁴ Adam Smith estimated the long run as starting at about 90 years. Joseph Schumpeter estimated the short run as lasting as long as 100 years. John Maynard Keynes observed that in the long run we all are dead. Generically, the law of contracts and the law of treaties views the maximum duration of a limited time contract or treaty as 99 years; and contracts in excess of 99 years as equivalent to in perpetuity.

- 117 II. A. 2. c. iii. [II.] [D.] Whether an economic loss
 118 (i.e., $\pi_A < \pi_N$) has been obtained?
 119 [i.] Note II.A.5.d.i.[I.][A.]: [shut
 120 down rule].
- 121 II. A. 2. c. iii. [III.] Note particularly II.A.4.: [where] and
 122 note II.A.6.: [ecological] and
 123 note II.B.2.: [time influences perception].
 124
- 125 II. A. 2. d. Power, law, and ethics serve different functions as criteria.
 126 i. In this document, the words "can" and "might"
 127 will be used to identify the criteria power to act.
 128 ii. In this document, the words "may" and "may"
 129 will be used to identify the criteria law
 130 (i.e., authorized behavior).
 131 [I.] A legal duty may exist when you can not act
 132 (i.e., you lack the power to act).
 133 [II.] For a **mere legal person** (e.g., corporation) it
 134 is correct to write that the power to act requires
 135 legal authorization (e.g., *Ultra Vires* doctrine).
 136 Accordingly, resist the temptation to write "the
 137 corporation can" rather than write "the
 138 corporation may" except in those
 139 circumstances when it is critical to distinguish
 140 an unlawful exercise of physical power to act
 141 from a lawful authority to act.
- 142 II. A. 2. d. ii. [III.] But, for a **natural person** (i.e., human) given
 143 the importance of II.A.2.d.iv.: [law \neq ethics]
 144 below it is very helpful to write "can" and
 145 "may" as appropriate for the context.
 146 iii. In this document, the words "should" and "ought"
 147 will be used to identify the criteria ethics.
 148 [I.] An ethical duty can not exist if you can not act
 149 (i.e., power to act is a prerequisite of
 150 an ethical duty).
 151 iv. While creation of law routinely is guided by ethics,
 152 what is legal is not necessarily ethical; nor *visa versa*.
 153

- 154 II. A. 2. d. iv. [I.] Creation of law
- 155 routinely is both temporally remote and
- 156 culturally remote from the
- 157 application of law
- 158 (i.e., what was ethical for "them" then is not
- 159 necessarily ethical for "us" today).
- 160 [II.] Law is a tool designed to be applied to groups
- 161 (e.g., legal duty is reasonable relative
- 162 to the Reasonable Person)
- 163 but law is applied to individuals
- 164 (e.g., natural person
- 165 within a corporation).
- 166 II. A. 2. d. iv. [II.] [A.] When all persons are acting lawfully
- 167 when a corporation acts, then, legally,
- 168 typically, only the corporation "acts"
- 169 even though acts of multiple natural
- 170 persons are necessary for that corporate
- 171 action.
- 172 II. A. 2. d. iv. [II.] [B.] Recall the difference between
- 173 II.A.2.d.ii.[I.]: [legal duty without
- 174 power to act]
- 175 versus
- 176 II.A.2.d.iii.[I.]: [ethical duty only with
- 177 power to act].
- 178 [III.] Law usually focuses upon objective knowledge
- 179 (i.e., either receipt of notice or reason to know)
- 180 while
- 181 ethics solely focuses upon subjective knowledge
- 182 (i.e., actual knowledge [a.k.a., *scienter*]).
- 183 3. Consequences.
- 184 a. Feasible.
- 185 i. Reality.
- 186 ii. Reasonable expectations.
- 187 iii. Actually expected.
- 188 iv. Known knowns versus known unknowns versus
- 189 unknown knowns versus **unknown unknowns**.
- 190 II. A. 3. a. v. [I.] **If**
- 191 **the set of**
- 192 **unknown unknowns is not a null set,**
- 193 **then**
- 194 **is the set of**
- 195 **known knowns a null set?**

- 196 II. A. 3. b. Countable.
- 197 i. Ought we count 0, 1, 2, 3, 4;
- 198 or,
- 199 ought we count 0, 1.62, 2.72, 3.14, 4.67?
- 200 c. Counts.
- 201 II. A. 4. Social: is it "us" versus "them"; or is it "us" and "them"?
- 202 a. Who are "us" and who are "them"?
- 203 i. Are "them" necessary for "us"?
- 204 ii. If the immediately preceding item
- 205 II.A.4.a.i.: [them are us] is true,
- 206 then is the distinction between "us" and "them"
- 207 specious?
- 208 b. When are "us" and when are "them"?
- 209 II. A. 4. b. i. Int**RA**-generational transfers
- 210 (e.g., unemployment insurance).
- 211 ii. Int**ER**-generational transfers
- 212 (e.g., infrastructure).
- 213 iii. Rule of 72: see, II.B.2.: [time preference].
- 214 c. What are "us" and what are "them"?
- 215 i. Prioritization of life forms: but, recall II.A.4.a.ii.:
- 216 [them are us].
- 217 II. A. 4. d. Where are "us" and where are "them"?
- 218 i. To what extent, if any, are "us" three dimensional
- 219 beings in a four dimensional time/space; and are
- 220 "them" identical in that regard?
- 221 e. Be here now. $\approx 11! * 20! * 13! \approx 6.0 \times 10^{36}$ meanings.
- 222 i. Note II.B.3.: [synchronicity].
- 223 5. Technological.
- 224 a. **Technology** is a combination of idea(s) and
- 225 physical embodiment(s).
- 226 b. **Technology** is the feasible combination of inputs.
- 227 i. Knowledge.
- 228 [I.] Recall the sources of "labor specialization"
- 229 from economics: ability, time on task, and
- 230 learning.
- 231 ii. Skills.
- 232 iii. Tools.

- 233 II. A. 5. c. Implicit blinders (e.g., See {literally, see the film} *My Dinner*
 234 *with Andre*) and explicit blinders (e.g., law's rules of
 235 evidence) alter what is seen.
- 236 i. Can not see (e.g., II.A.3.a.iv.; especially [I.]:
 237 [unknown unknowns])
- 238 ii. Acutely see.
- 239 [I.] The professional's blinders
 240 (e.g., thinking like a businessperson)
 241 facilitates focus both by
 242 minimizing distraction by low priority stimuli
 243 and by
 244 enhancing the visibility of high priority stimuli.
- 245 iii. Criteria of appraisal changed by change itself.
- 246 [I.] Unpredictable consequences.
- 247 [A.] Good idea
 248 experienced as bad consequence.
- 249 II. A. 5. c. iii. [I.] [B.] Interplay of II.A.3.a.iv.[I.]: [unknown
 250 unknowns]
 251 with II.A.5.e.i.: [law can not anticipate]
 252 with II.A.5.f.i.[III.][A.][1.]: [feedback
 253 loop; see also V.I.: [feedback loops]]
 254 with II.B.3.: [synchronicity]
 255 with III.A.1.a.: [whole greater than sum
 256 of parts; see also V.F.: [nonisomorphic
 257]].
- 258 [II.] *Contra*, Rawles' **veil of ignorance** supports
 259 creation of coherence across full range of
 260 known feasible changes.
- 261 iv. **Coherent** criteria (i.e., stable across contexts) are
 262 superior criteria for appraisal.
- 263 [I.] Money is objective rather than coherent.
- 264 II. A. 5. c. iv. [II.] As scope of consequence increases
 265 both
 266 the coherence of objective criteria decreases
 267 and
 268 social urge to use objective criteria increases.
- 269 [III.] Note II.A.5.f.i.[III]: [economies of scope] and
 270 note III.C.4.: [scope].
- 271

- 272 II. A. 5. d. Implicit value structure.
- 273 II. A. 5. d. i. When technological change is an "advance"
- 274 depends upon the criteria;
- 275 recall I.A.7.: [positivist versus normative].
- 276 [I.] Schumpeter: **creative destruction**.
- 277 [A.] Economic obsolesce involves use of the
- 278 **Shut Down Rule**: $TR < VC$.
- 279 [1.] Old technology becomes
- 280 economically obsolete when
- 281 $AVC_{old} > ATC_{new}$.
- 282 [2.] Since economic obsolesce is, no
- 283 less than partially, triggered by
- 284 events external to the firm it can
- 285 arrive instantaneously and/or
- 286 unexpectedly.
- 287 [B] Technological obsolesce is a functional
- 288 question rather than a question of cost.
- 289 [C.] Accounting obsolesce (e.g., terminal
- 290 date of straight line depreciation) is an
- 291 objective forecast of useful life that
- 292 might or might not be linked in any way
- 293 to either technological obsolesce or
- 294 economic obsolescence.
- 295 II. A. 5. d. i. [II.] Schumacher: **contextual appraisal**.
- 296 II. A. 5. d. i. [II.] [A.] Far less than most often,
- 297 bigger is cheaper
- 298 (e.g., Schumacher's *Small is Beautiful*).
- 299 [III.] Veblen: **conspicuous consumption**.
- 300 [A.] Value is dependent both upon context
- 301 and upon reflection within that context.
- 302 ii. Which tool attributes is/are necessary for the
- 303 appraisal of change to be correct?
- 304 [I.] Static versus dynamic.
- 305 [II.] Mechanical versus biological.
- 306 [III.] Equilibrium versus chaotic.
- 307 **II. A. 5. e. Law can not anticipate.**
- 308 i. Reasonable expectations are by definition historical.

- 309 II. A. 5. f. Due to the relatively minimal constraints attributable to the
 310 physical embodiment component of technology,
 311 technology is an economically distinctive input.
- 312 i. *Within bounds*
 313 *that are far less bounded than is ordinary,*
 314 *technological change often **incorrectly** is viewed*
 315 *as allowing economies of scale to be feasible.*
- 316 [I.] Economies of **scale** =
 317 proportional increase in all inputs generates
 318 an increase in total cost but
 319 less than a proportionate increase in average
 320 cost; so that the LRATC falls as output rises.
- 321 [A.] Recall economist's long run in
 322 II.A.2.c.ii.[II.]: [long run].
- 323 [II.] **Economies of size** =
 324 proportional increase in most inputs generates
 325 an increase in total cost but
 326 less than a proportionate increase in average
 327 cost; so that the LRATC falls as output rises.
- 328 [A.] **MES**: minimum efficient size.
- 329 [III.] Economies of **scope** (a.k.a., **network effect**) =
 330 proportional increase in the
 331 market(s) generating and/or market receiving
 332 the inputs and/or the outputs of a market
 333 participant generates a more than proportionate
 334 decrease in LRATC of that participant's output.
- 335 II. A. 5. f. i. [III.] [A.] Within a process and across processes
 336 are linkages for obtaining inputs and
 337 sending outputs
- 338 [1.] A **feedback loop** connects
 339 the past status of a system part
 340 both forward to one or more
 341 system parts as well as backward
 342 to that system part's future self.
- 343 [B.] Feedback loops tend to accentuate
 344 other processes:
 345 see, V.I.: [feedback loops].
- 346 [C.] Note, III.C.4.: [scope].
- 347 [IV.] But, recall II.A.2.c.: [sustainability];
 348 especially recall II.A.2.c.i.: [strong
 349 sustainability] versus II.A.2.c.ii.: [weak
 350 sustainability].

- 351 II. A. 5. f. i. [V.] In these estimations of ATC
 352 (i.e., average total cost) how broadly
 353 (e.g., II.A.2.c.i.: [sustainability]) is "total"
 354 estimated? See also, III.D.5.b.: [labor
 355 productivity versus total productivity]
- 356 II. A. 6. **Ecological** (i.e., relations and interactions between organisms and
 357 their environment [e.g., habitat], including other organisms).
- 358 a. What is the priority ranking of every life form?
- 359 i. Which life forms on Earth are
 360 *sine qua non* for human life?
- 361 ii. Recall II.A.4.: [us versus them] and
 362 recall II.A.5.f.i.: [technology not yield scale].
- 363 II. A. 6. b. Can rape of the Earth be good stewardship?
- 364 i. **Private goods**,
 365 generically, are notable for their characteristics of
 366 rivalry of consumption and exclusivity of possession.
- 367 ii. **Public goods**,
 368 generically, are notable for their characteristics of
 369 externalities
 370 springing from muted characteristics of rivalry or of
 371 exclusivity.
- 372 I. A. 6. b. ii. [I.] An **externality** (a.k.a., spillover) does not
 373 register as "supply" and an externality does not
 374 register in the market as "demand". The market price
 375 is a **zero price** for some fraction (?whole?) of the
 376 externality. That zero price prevents the allocative
 377 effect of the market, thereby generating excessive
 378 consumption for spillover costs and insufficient
 379 consumption for spillover benefits.
- 380 iii. Waste (i.e., real property law) is a breach of a legal
 381 duty or of legal duties.
- 382 [I.] **Waste** is misappropriation of
 383 the ownership rights of either
 384 concurrent or subsequent owners.
 385

- 386 **II. A. 6. c. What is the minimum feasible number of**
 387 **generations for an evolutionary consequence in a**
 388 **life form** (i.e., what is minimally necessary fraction of total
 389 population that must carry a gene; as well as what is the
 390 relevant average fecundity)?
- 391 II. A. 6. c. i. Is it the
 392 "seventh generation of the seventh generation"?
- 393 [I.] E.g., approximately 266 years
 394 if assuming Thomas Jefferson's generational
 395 estimate of 19 years times 14 generations;
 396 or, e.g., approximately 350 years
 397 if assuming a 2006 USA mother's age of 25 at
 398 birth of first child.
- 399 [A.] See, II.B.2.a.iv.[I.]: [penny = million
 400 \$].
- 401 ii. How does the metric "generation"
 402 vary across life forms?
- 403 [I.] Which existing technologies
 404 have generated an evolutionary consequence
 405 in some life form (e.g., antibiotic resistance)?
- 406 [II.] Which technologies have done so in humans
 407 (e.g., speech has; but not [?yet?] graphs)?
- 408 II. A. 6. c. ii. [III.] Given how you answered
 409 II.A.6.c.: [minimum number of generations]
 410 and
 411 II.A.6.c.ii.: [metric of a generation],
 412 relative to which other life forms on Earth,
 413 moving into the future,
 414 do humans have and do humans not have
 415 an advantage over most other life forms for
 416 gaining beneficial evolutionary consequence?
- 417 II. A. 7. Positivist versus Normative.
- 418 a. Recall Einstein counting.
- 419 b. Science strives to be positivist and
 420 science strives to minimize being normative.
- 421 c. **Positivism** (a.k.a., *scientific method*)
 422 seeks to avoid values (e.g., observer bias) and instead
 423 seeks to solely focus on **facts**.
- 424 i. **Facts** are asserted to be objective
 425 (i.e., perception of a Reasonable Person)
 426 rather than to be subjective
 427 (i.e., natural person's personal perception).

- 428 II. A. 7. c. ii. **Facts** exhibit consistency of perception across
 429 different observers.
- 430 [I.] Opinions are subjective; and
 431 the mean opinion
 432 has a relatively larger variance.
- 433 [II.] In a court of law
 434 the opinions of experts are accepted as if *fact*
 435 because
 436 the opinions of experts cluster sufficiently
 437 tightly to warrant judicial acceptance: recall,
 438 II.A.5.c.: [rules of evidence].
- 439 II. A. 7. d. **Normative**
 440 explicitly recognizes and seeks to inventory
 441 the values explicit and implicit in all *facts* (e.g., GDP, profit).
- 442 i. Normative asserts
 443 it is impossible to extinguish observer bias.
 444 That is, at best can expressly manage influence of the
 445 observer bias.
- 446 ii. Normative asserts
 447 that the choice of the *facts* is inherently normative.
- 448 [I.] But note, New York Senator Daniel Patrick
 449 Moynihan, former U.S.A. Ambassador to the
 450 U.N., was fond of observing that
 451 "*Everyone is entitled to his own opinion,*
 452 *but not his own facts.*".
- 453 e. See also II.A.2.a.: [criteria for "good" and for "bad"].
- 454 II. B. Each conception of time influences what is perceived.
- 455 1. Stream of time.
- 456 a. Unidirectional causation (i.e., past then present then future).
- 457 b. **Clock time** a.k.a., *classical time*, is an
 458 artificial human abstraction created to foster
 459 positivist objective perceptions. See below, V.K.: [real
 460 versus classical time].
- 461 i. An advantage of clock time is that its units are
 462 infinitely divisible and infinitely aggregatable;
 463 as well as ranges from infinite past to infinite future.
- 464 II. B. 1. b. ii. A disadvantage of clock time is that the unit of clock
 465 time selected for use during a study need not bear any
 466 relationship whatsoever to the process cycles being
 467 studied.

- 468 II. B. 1. b. ii. [I.] There is a clear risk of specifying a
 469 unit of clock time that quite likely precludes the
 470 ability to perceive a process cycle being studied
 471 because the unit of clock time is vastly different
 472 (either larger or smaller) than the process cycle
 473 (e.g. study days when process cycle takes place
 474 in seconds; or study days when process cycle
 475 takes place in decades).
- 476 2. Discounting of the dollar value of time.
- 477 a. Dollar value varies with magnitude of temporal separation.
- 478 i. E.g., a rough estimator of the compounding process is
 479 the **Rule of 72**:
 480 $72 / i =$ periods to double or to halve a dollar value
 481 via compound interest earned or via compound
 482 interest owed.
- 483 [I.] That compound period interest rate, i ,
 484 is written as an integer
 485 (e.g., 7.2 rather than 0.072).
- 486 [A.] A \$1 loan for a period of ten years at
 487 7.2% simple interest would require the
 488 debtor to pay the creditor the principal
 489 of \$1 plus the interest of $\$1 * 0.072 * 10$;
 490 that is, \$1.72.
- 491 [B.] On a \$1 loan for a period of ten years at
 492 7.2% compound interest would require
 493 the debtor to pay the creditor the
 494 principal of \$1
 495 plus the interest which included interest
 496 earned on the interest (e.g., year two's
 497 interest is $\$1.072 * 0.072$, or 0.77); for a
 498 total repayment of \$2.00. The formula,
 499 stated in terms of the compound interest
 500 rate is:
 501 $i = (\{FV / PV\}^{1/n}) - 1$.
- 502 ii. Helps answer II.A.4.b.: [when are us & them].
- 503 II. B. 2. a. iii. Typically
 504 ignores II.B.3.: [synchronicity]
 505 as well as typically
 506 ignores III.A.: [$\pi = TR - TC$];
 507 ignores III.B.: [ethics is multiple systems]; and
 508 ignores III.C.: [complex systems interacting].
 509

- 510 II. B. 2. a. iv. Discounted present value routinely requires a host of
 511 implicit assumptions that rarely individually or
 512 collectively are accurate: if ever accurate (recall,
 513 II.A.5.c.iv.[I.]: [money is objective rather than
 514 coherent]).
- 515 [I.] At 7.2% compound annual interest, a debt of
 516 \$1 borrowed today and payable at the end of
 517 10 years is doubled as a debt by the
 518 debt's interest payment of \$1;
 519 similarly, in this way,
 520 at 7.2% simple annual interest a
 521 cost of $\$1.0 \times 10^6$ is imposed
 522 276 years in the future but, today, is
 523 only "worth" $\$1.0 \times 10^{-2}$.
- 524 II. B. 2. a. iv. [I.] [A.] When a future cost (e.g., externality) is
 525 currently estimated and discounted,
 526 *vary rarely* is a **sinking fund**
 527 currently created and that penny
 528 deposited so in that future 276 years
 529 hence so that the compounded interest
 530 earned on that today penny so that
 531 future million dollar harm is
 532 compensated (e.g., II.A.4.b.ii.:
 533 [intERgenerational transfers]).
- 534 II. B. 2. b. Time preference.
- 535 i. Discounting
 536 implicitly prefers the present over the future.
- 537 ii. Adequate deposits into a
 538 II.B.2.a.iv.[I.][A.] sinking fund
 539 *might* reflect a balanced time preference
 540 rather than a biased time preference.
- 541 II. B. 2. b. iii. Given II.A.3.a.iv.[I.]: [unknown unknowns],
 542 use of II.B.4.b.i.: [Precautionary Principle]
 543 might be required to demonstrate a balanced rather
 544 than a biased time preference.
- 545

- 546 **II. B. 3. Synchronicity.**
- 547 a. Sequencing of process inputs and outputs.
- 548 i. Time is certain to be:
- 549 [I.] Linear;
- 550 [II.] Cyclical
- 551 (e.g., feedback loop); **and/or**
- 552 [III.] Alternating
- 553 (e.g., contextually defined directionality
- 554 for a feedback loop).
- 555 b. Punctuality of process inputs and outputs.
- 556 **II. B. 3. c. Duration of process inputs and outputs.**
- 557 d. Coordination of process inputs and outputs.
- 558 4. Preferences related to risk: risk averse, risk neutral, and risk
- 559 seeking.
- 560 a. Speaking technically,
- 561 "uncertainty" does not equal "probability";
- 562 nor does "uncertainty" equal "risk".
- 563 i. Rarely will you encounter a human who
- 564 consistently speaks technically about
- 565 hazard, reward, uncertainty, probability, and/or risk;
- 566 instead humans routinely and erroneously substitute
- 567 one for the other.
- 568 ii. **Hazards** and **rewards** are consequences.
- 569 Hazards are a negative consequence.
- 570 Rewards are a positive consequence.
- 571 **II. B. 4. a. iii. Uncertainty (duh!) is a lack of certainty:**
- 572 that is,
- 573 a context where
- 574 it is not possible either to identify
- 575 the different feasible consequences or
- 576 it is not possible to measure
- 577 the relative frequency of the different consequences.
- 578 [I.] Recall II.A.3.a.i.[I.]: [unknown unknowns].
- 579 [II.] Some assert that randomness is a prerequisite
- 580 for certainty and probability.
- 581 [A.] See, II.B.4.f.i.: [random]; and
- 582 see, II.B.4.f.i.[II.].[A.]: [random
- 583 distribution].

- 584 II. B. 4. a. iii. [III.] Given the implicit definition of certainty in
 585 II.B.4.a.iii. is there always uncertainty?
 586 Recall, II.A.3.a.i.[I.]: [unknown unknowns].
- 587 II. B. 4. a. iv. **Probability** exists when it is both
 588 possible to identify the different consequences
 589 *and*
 590 possible to measure the relative frequency
 591 of the different consequences (e.g., likelihood).
- 592 v. **Risk** is *deviation from expected* probabilities
 593 mathematically coupled with the rewards and the
 594 hazards.
- 595 [I.] Does the Bayesian decision tree
 596 display risk, uncertainty, or neither?
- 597 [II.] Recall II.B.4.a.ii.: [hazard and rewards] and
 598 recall that humans frequently substitute
 599 risk for hazard as well as substitute
 600 uncertainty for probability.
- 601 II. B. 4. b. **Risk Averse** =
 602 decision maker prioritizes avoidance of large hazards;
 603 thus, voluntary acceptance of large risks requires
 604 rewards to be disproportionately larger
 605 (since probabilities are assumed not alterable).
- 606 **II. B. 4. b. i. Precautionary Principle** =
 607 for major risks shared broadly (e.g., externalities) the
 608 decision maker ought prioritize
 609 avoidance of worst case outcomes even if
 610 probabilistic assessment reasonably forecasts
 611 significantly profitable risk taking for the individual
 612 decision maker and significantly profitable risk taking
 613 for the broader social context.
- 614 II. B. 4. b. i. [I.] Recall II.A.2.c.i.: [strong sustainability]
 615 versus
 616 recall II.A.2.c.ii.: [weak sustainability];
 617 as well as
 618 recall II.A.4.: [us versus them; or, us = them].
- 619 II. B. 4. c. **Risk Neutral** =
 620 voluntary acceptance of all risks as long as
 621 hazards and rewards track proportionally with the risk.
- 622 i. Economics, seeking to be positivist,
 623 *assumes* a rational person and then
 624 *assumes* all rational persons are risk neutral and then
 625 *assumes* all natural persons are rational persons.

- 626 II. B. 4. c. i. [I.] Based upon the flip of fair coin, what reward do
 627 you require for you to voluntarily accept your
 628 slavery as a hazard?
 629 [A.] Are you risk neutral?
- 630 II. B. 4. c. i. [I.] [B.] Are you rational?
- 631 II. B. 4. d. **Risk Seeking** =
 632 decision maker prioritizes large rewards
 633 over smaller rewards, thus voluntary acceptance of
 634 larger hazards and/or large risks does not require rewards to
 635 be grow proportionately with risks.
- 636 i. Small rewards tend to be assimilated by the current
 637 context without fundamentally transforming the
 638 current context; whereas, large rewards tend to
 639 transform the current context, and that change in
 640 context is what is desired rather than the reward
 641 itself.
- 642 ii. PowerBall probabilities are 1 in 2.0×10^8
 643 with gross rewards rarely as good as $\$1.0 \times 10^8$; and
 644 yet very many tickets are sold at $\$1.0 \times 10^0$:
 645 who buys PowerBall tickets and why?
- 646 [I.] Note how PowerBall as an example of
 647 risk seeking incorrectly uses the concept of
 648 "risk" in the routine manner of that common
 649 error.
- 650 II. B. 4. d. iii. Is the word "risk" used in the II.B.4.b.: [risk averse]
 651 item with its II.B.4.a.v.: [risk] technical definition
 652 or
 653 with its II.B.4.a.i. vernacular definition (e.g., hazard)?
 654 Which definition of "risk" is used in
 655 II.B.4.c.: [risk neutral] and in
 656 II.B.4.d.: [risk seeking]?
 657 Re-read each item very carefully.
 658 In any one of those locations has the meaning of
 659 hazard been erroneously substituted when the word
 660 "risk" is used? While all knowledgeable persons use
 661 the phrase "risk averse", the vast majority of those
 662 users really mean "hazard averse" because they are
 663 not focusing upon any deviation from the expected
 664 probabilities.
- 665 II. B. 4. e. A **Black Swan** is a low probability event with a large
 666 consequence. Accordingly, a Black Swan posses high risk.
 667 The deviation from the expected probability is more likely
 668 because accurate estimation of low probability decreases
 669 with II.A.3.a.iv.[I.]: [unknown unknowns].

- 670 II. B. 4. e. i. What are the differences in consequences between
 671 a *positive Black Swan* and a *negative Black Swan*?
- 672 II. B. 4. f. When is a characteristic:
 673 i. **random**?
- 674 [I.] Recall II.B.4.a.iii.[II.]: [randomness is a
 675 prerequisite for certainty and probability].
- 676 II. B. 4. f. i. [II.] The definition of *random* varies by the purpose
 677 of the definition. Generically, random means
 678 having no specific pattern, purpose, or
 679 objective. Statistically, random means of or
 680 relating to a type of circumstance or event that
 681 is described by a probability distribution.
 682 Here, *random* means a specific statistical
 683 pattern (i.e., normal curve).
- 684 II. B. 4. f. i. [II.] [A.] The probability distribution of the
 685 **normal curve** ranges from negative
 686 infinity to positive infinity; its mean,
 687 median, and mode are identical; is
 688 symmetrical; and the frequency of
 689 occurrence decreases at an increasing
 690 rate of decrease as move away from the
 691 mean/median/mode.
- 692 ii. *chaotic* (e.g., **Butterfly Effect**)?
- 693 [I.] Some assert the *Butterfly Effect* necessarily
 694 violates Newton's Laws of Motion (i.e.,
 695 1st inertia;
 696 2nd $f=ma$; and
 697 3rd equal and opposite reaction)
 698 and/or
 699 violates Newton's Laws of Thermodynamics (i.e.,
 700 1st conservation of energy;
 701 2nd entropy in a closed system; and
 702 3rd absolute zero not reached).
- 703 II. B. 4. f. ii. [I.] [A.] Instead, the *Butterfly Effect* functions via
 704 processes that are context dependent
 705 (e.g., H₂O is solid below 0° C and is a gas
 706 above 100° C) due to catalytic agents and
 707 feedback loops in open systems.
 708

- 709 II. B. 4. f. ii. [II.] **Chaos theory** posits that dynamic systems
 710 (simple or complex) exhibit a system
 711 characteristic of sensitivity to initial conditions;
 712 such sensitivity being very responsive to any
 713 uncertainty. That is, II.B.4.a.v.: ["risk"]
 714 rapidly escalates and compounds.
- 715 [A.] Some systems have predictable
 716 properties, others do not.
 717 An example of a predictable property is
 718 the *Butterfly Effect*: a major variation
 719 in consequence due to a minute
 720 variation in inputs.
- 721 [B.] Note as somewhat opposite view in
 722 *Coase's Theorem* at III.D.4.
- 723 iii. unpredictable?
- 724 [I.] *Uncertainty* of II.B.4.a.iii. is only one form of
 725 unpredictable.
- 726 II. B. 4. f. ii. [II.] Recall II.A.5.c.iii.[I.]: [unpredictable
 727 consequences].
- 728 iv. Recall II.A.3.a.iv.[I.]: [unknown unknowns].
 729
 730
- 731 III. A network as a context for consequence alters the array of feasible consequences.
 732 A. *Size*.
- 733 1. Maximum size of an individual part
 734 is exceeded by aggregation of individual parts.
- 735 a. Across multiple dimensions,
 736 ***the whole is greater than the mere sum of the parts.***
- 737 2. Recall relative consequences discussed in
 738 II.B.2.a.iv.[I.]: [penny = million \$]
 739 as well as in
 740 II.B.4.b.i.: [Precautionary Principle].
- 741 B. *Scale*.
- 742 1. A proportional increase in *all inputs*
 743 results in a proportional increase in output.
- 744 III. B. 1. a. A scale result is both more feasible and more likely
 745 with an aggregations of units versus with individual units.
 746

- 747 III. B. 1. b. The **law of diminishing marginal returns**
 748 counsels that increasing a *single input* initially might result
 749 in a more than proportional increase in total output; but
 750 beyond a certain point increases in that *single input* results
 751 in a less than proportional increase in output; and,
 752 ultimately a decrease in total output.
- 753 C. *Scope.*
- 754 1. Classic definition of *network effect* springs from scope.
- 755 2. **Proximately caused** (i.e., reasonably foreseeable) consequences
 756 both on distant processes and in distant systems
 757 via alteration of *synchronicity* across *feedback loops*.
- 758 III. C. 3. *Scope* consequences alter:
 759 a. parts,
 760 b. subunits,
 761 c. aggregations of parts and of subunits, and/or
 762 d. the whole.
- 763 III. C. 4. *Scope*, with no change in technology, can be
 764 similar in consequence to a change in II.A.5.b.: [technology is the
 765 *feasible* combination of inputs].
- 766 a. *Feedback loops*
 767 can alter positively and can alter negatively what is feasible.
- 768 b. Recall all of II.A.5.: [technological].
- 769 c. Recall II.A.5.c.iii.[I.][B.]: [interplay];
 770 recall II.A.5.f.i.[III]: [network effect];
 771 recall II.B.3.: [synchronicity]; and
 772 note V.I.: [feedback loops].
- 773 D. Optimization.
- 774 1. Whose utils are to be maximized?
- 775 a. Recall II.A.4.: [us v. them; or us & them].
- 776 2. Benefit / Cost Analysis.
- 777 a. What are the implicit values expressed when the ratio is
 778 phrased as benefit/cost versus phrased as "cost/benefit"?
- 779 III. D. 2. b. Is the mathematical interpretation of the ratio benefit/cost
 780 substantially similar to the interpretation of
 781 the ratio cost/benefit?
- 782 3. **Pareto Optimality:**
 783 change only is "good" if improve one without harm any.
- 784 a. Contrast with **Pareto Principle:**
 785 20% of inputs yield 80% of outputs.

- 786 III. D. 4. Coase Theorem:
 787 **if** few transactions
 788 **and if** small transaction costs individually and in aggregate,
 789 **then** (*but not so if either of the above ifs is not satisfied*)
 790 initial allocation does not preclude efficient end allocation
 791 via market transactions in the long run.
- 792 a. *Coase Theorem* helps define the efficient boundary between
 793 the firm and the market.
- 794 b. Coase Theorem is routinely ***mis***applied
 795 to fallaciously justify gross inequalities coupled with
 796 governmental non-response (e.g., externalities).
- 797 c. Recall II.A.2.c.ii.: [weak sustainability] and
 798 recall II.A.2.c.ii.[II.]: [economist's long run].
- 799 III. D. 5. Cobb-Douglas function:
 800 $Y = A L^\alpha K^\beta$
 801 where
 802 Y = total production; A = total factor productivity;
 803 L = labor; α = elasticity; K = capital; and β = elasticity.
- 804 a. These elasticities are used to define economies of scale.
- 805 b. What is the difference between labor productivity and
 806 total factor productivity?
- 807 III. D. 5. b. i. Recall II.A.2.c.i.: [strong sustainability]
 808 versus
 809 recall II.A.2.c.ii.: [weak sustainability];
 810 as well as
 811 recall III.4.C.iii.: [multiple recall of feedback loops].
- 812 III. D. 6. Subunit optimization at the expense of the whole becomes a
 813 discrete source of subunit "profit".
- 814 a. Also known as the ***principle / agent problem***.
- 815 b. Can be explored from the perspective of ***rent seeking***.
- 816 c. Recall II.A.4.: [us v. them; or us & them] and
 817 recall II.B.4.b.i.: [Precautionary Principle].
- 818 E. ***The Tipping Point: How Little Things Can Make a Big Difference*** by
 819 Malcom Gladwell. ISBN: 0316346624. HM1033 .G53 2002.
- 820 1. **Law of the Few.**
- 821 a. ***Connectors*** to facilitate transmission.
- 822 i. In Milgram's Omaha-to-Boston
 823 ***six degrees of separation*** a few connectors were
 824 responsible for half of the deliveries.

- 825 III. E. 1. a. ii. The age of information, paradoxically, also is the
826 *age of isolation*.
- 827 [I.] As information flow increases, especially when
828 the flow exceeds the channel capacity
829 *immunity* to communication via that channel
830 sets in.
- 831 [A.] A decrease in the cost of a mode of
832 communication tends to trigger both an
833 increase in the quantity of
834 communication via that mode as well as
835 an increase in the *immunity* of
836 recipients via that mode.
- 837 [1.] *Fax effect* as contrasted with
838 email's *law of plenty*.
- 839 [II.] As immunity sets in the relative importance of
840 *word of mouth* communication increases.
- 841 [III.] Immunity is stimulated when the recipient of a
842 communication experiences conflict between
843 the recipient's internal word view and the
844 external world view being communicated.
- 845 b. **Mavens** collect and transmit a vastly disproportionate
846 amount of information.
- 847 i. The relative importance of *mavens* increases as
848 *immunity* increases along with *isolation*.
- 849 c. *Salesmen* perform the function of persuasion that is
850 necessary for adoption.
- 851 2. **Sticky concept.**
- 852 a. Information washout via flooding unless information is
853 memorable.
- 854 3. **Power of Context.**
- 855 a. Environmental conditions welcome or oppose transmission
856 (e.g., seasonality in transmission of STDs).
- 857 b. Environmental conditions signal
858 (e.g., *broken window effect*) receptivity to some transactions
859 (e.g., crime).
- 860 c. Group awareness and involvement preserves, cultivates, and
861 transmits stimuli.
- 862 i. Channel capacity constrains and focuses
863 transmissions.

- 864 III. E. 4. The interplay of the law of few, stickiness, and the power of context
865 control the process of *diffusion*.
- 866 a. The sequence of adoption is:
- 867 [i] innovators;
- 868 [ii] early adopters;
- 869 [iii] early majority;
- 870 [iv] late majority; and finally
- 871 [v] laggards.
- 872 b. Early adopters perform the function of *translation* of the
873 innovators' vision into a conceptualization concordant with
874 the main stream so that the early majority feels comfortable
875 making the adoption decision.
- 876
- 877
- 878 **IV. General Systems Analysis (GSA) prioritizes a focus on**
879 **relationships, structure, and interdependency**
880 **rather than a focus on constant attributes of objects.**
- 881 **A. Openness, complexity, wholeness, hierarchy, and regulation**
882 **set up those relationships, structure, and interdependence.**
- 883 **B. Within a dynamic whole**
884 **a part functions differently than when the part is examined**
885 **in isolation.**
- 886
- 887
- 888 **V. Twelve Principles of Systems.**
- 889 A. A system is a set of objects
890 together with relationships between objects and their attributes.
- 891 1. Objects are elements (e.g., parts, subparts).
- 892 2. Attributes are properties (e.g., trigger levels and tolerance levels).
- 893 3. Relationships connect with iterations (e.g., cycles of cycles).
- 894 a. Due to our **Bounded Rationality**
895 we are prone to tell ourselves the lie of uni-dimensionality.
- 896 i. All rational decision makers suffer from Bounded
897 Rationality due to the infirmities of limited intellect,
898 limited knowledge, and limited time for analysis and
899 decision. Accordingly, the quality of a decision is
900 measured against the constraints of those infirmities.

- 901 V. B **All systems are open** (but, recall II.B.4.f.ii.[I.]: [Newton's Laws of
902 Motion and Laws of Thermodynamics]).
- 903 1. **Openness is a flow** (i.e., typically both inputs and outputs)
904 between the system being examined and its environment (i.e.,
905 multiple, other systems).
- 906 2. The state of a system is influenced by its flows.
- 907 3. **Environment routinely viewed as a**
908 **black box** that is source of:
- 909 a. Recall II.A.2.c.: [sustainability]; and
910 recall II.A.6.b.i: [private goods] versus
911 recall II.A.6.b.ii.: [public goods].
- 912 b. Natural good production (e.g., forest);
- 913 V. B. 3. c. Natural resources (e.g., oil);
914 d. Living Systems
915 (a.k.a., Life Support Services [e.g., atmosphere]);
916 e. *Sink Function* (e.g., absorb and process human pollution).
- 917 C. Systems are **nonisomorphic** (i.e., whole is greater than sum of parts).
918 1. a.k.a., holistic.
919 2. Rejects reductionist thinking of objects viewed in isolation.
- 920 V. D. Systems stress **equifinality**.
921 1. Posits multiple feasible paths rather than focus on equilibrium.
922 a. Forecasting the future
923 (e.g., start with an ice cube and end with ?)
924 is far easier than
925 forecasting the past
926 (e.g., now a puddle of water having started with ?).
- 927 b. Managers generally focus on the task of **backcasting**.
928 That is, identify a future date and future status, and then
929 actively constrain present and intermediate events so as
930 maximize the likelihood of that identified future status being
931 achieved by the identified future date.
- 932 2. Recall *can* versus *may* versus *should* (i.e., power v. law v. ethics)
933 at II.A.2.d.
- 934 E. System components interact.
- 935 1. Cultural values (e.g., Golden Rule versus invisible hand versus
936 golden rule [there are two rules known as the "golden rule"]).
- 937 2. Social beliefs (e.g., free will versus fate).
- 938 3. Personal attitudes (e.g., risk preference a.k.a., hazard preference).

- 939 V. E. 4. Technology: recall II.A.5. through II.A.5.f.i.[V].
- 940 5. Natural Environment (e.g., wild versus depleted).
- 941 F. Systems operate within constraints imposed by
- 942 the system's controls and the system's regulations.
- 943 1. Magnitude of constraints vary.
- 944 a. **Necessary.**
- 945 i. If system part #A is necessary for system part #B,
- 946 and if part #A is present,
- 947 then part #B might or might not be present;
- 948 but,
- 949 if part #A is absent, then part #B is absent.
- 950 ii. Recall II.A.2.b.: [necessarily competing explicit and
- 951 implicit system goals] and
- 952 recall II.A.3.a.iv.[I.]: [unknown unknowns].
- 953 b. **Sufficient.**
- 954 i. If system part #A is sufficient for system part #B,
- 955 and if part #A is present,
- 956 then part #B must be present;
- 957 and if,
- 958 if part #A is absent, then part #B is absent.
- 959 c. Adequate.
- 960 d. Viable.
- 961 V. F. 2. Subsystem linkages
- 962 provide additional venues for control and regulation.
- 963 3. Rules of control and rules of regulation
- 964 are both alterable and interactive.
- 965 V. F. 4. **Technology**
- 966 interacts with control and regulation in a multitude of ways
- 967 (e.g., *mechanism* for control versus *alters* controls).
- 968 i. Recall II.A.2. through II.A.2.d.iv.[III.]: [criteria] and
- 969 recall II.A.5. through II.A.5.f.[V.]: [technological] and
- 970 recall II.B.3. through II.B.3.d.: [synchronicity] and
- 971 recall III.C. through III.C.4.b.: [scope].
- 972 V. F. 5. Social beliefs
- 973 interact with control and regulation in a multitude of ways
- 974 (e.g., view of what is feasible
- 975 [e.g., USA racism prior to Martin Luther King]).
- 976 a. Law assumes a Reasonable Person.
- 977 Recall II.A.5.e.: [law can not anticipate; reasonable
- 978 expectations necessarily are historical]

- 979 V. F. 5. b. Economics assumes a Rational Person.
 980 Recall II.B.4.c.i.: [economics seeks to be positivist via risk
 981 neutrality].
- 982 c. Who is more likely to succumb to **group think**:
 983 a natural person, a legal person,
 984 a Reasonable Person, or a Rational Person?
- 985 V. G. Systems contain hierarchies.
- 986 1. Outputs of subsystems
 987 provide inputs to other subsystems and/or systems.
- 988 2. Hierarchies increase scope of reasonably foreseeable
 989 (i.e., proximate cause) consequences.
- 990 H. A system can be viewed via its **flows**, its **deliveries**, and its **sequences**.
- 991 1. Threshold levels trigger reaction
 992 within or outside of the system.
- 993 2. Tolerance levels when exceeded trigger transformation
 994 within or outside of the system.
- 995 3. Recall II.B.3.: [synchronicity] and
 996 recall II.B.4.f.ii.: [chaos theory] and
 997 recall V.F.1.: [magnitude of constraints vary].
- 998 I. **Feedback loops** can be positive or can be negative.
- 999 1. **Positive feedback** is self reinforcing.
- 1000 a. If the flow is both above the threshold and below the
 1001 tolerance levels, then the feedback loop fosters growth.
- 1002 i. But, tendency towards instability and/or decay.
- 1003 V. I. 1. a. ii. A positive feedback loop can aggregate flow until the
 1004 flow exceeds the tolerance level; potentially triggering
 1005 unrestrained growth that collapses the system if that
 1006 flow either consumes to exhaustion a source of inputs
 1007 or produces outputs that swamp the system.
- 1008 b. Positive feedback often serves as
 1009 both intra-system and inter-system communication.
- 1010 2. **Negative feedback** is self-regulating and fosters goal direction.
- 1011 a. The dampening consequences of a negative feedback reduce
 1012 the likelihood of a run-away process.
- 1013 i. Easily confused with Newton's 2nd law of
 1014 thermodynamics at II.B.4.f.ii.[I].
- 1015

- 1016 V. I. 3. Stimulation of a system's feedback loops (either positive or
 1017 negative) by a force external to the system which can magnify the
 1018 scope of consequences; feasibly triggering multiple system collapse
 1019 if necessary subsystems or if sufficient subsystems either are
 1020 starved of inputs or are swamped by inputs.
- 1021 a. Recall II.B.4.f.ii.[I.]: [chaos theory] and
 1022 recall II.A.5.c.iv.[II.]: [as scope increases coherence of
 1023 objective criteria decreases] and
 1024 recall II.A.5.f.i.[III.]: [network effect] and
 1025 recall III.C. through III.C.4.b.: [scope].
- 1026 V. J. **Systems** foster differentiation and elaboration.
- 1027 1. **Evolution towards complexity** (i.e., not entropy).
- 1028 a. Note, Newton's 2nd law of thermodynamics at II.B.4.f.ii.[I.].
 1029 uses the assumption of a closed system which is contrary to
 1030 open systems principle at V.B.
- 1031 V. K. Systems use **real time** rather than *classical time*.
- 1032 1. Newtonian time relies upon strict deterministic causality.
- 1033 a. Contrast with *equifinality* principle at V.D.
- 1034 2. Time is a social construct rather than a natural phenomena.
- 1035 a. Focus on process *synchronicity*; not clock time.
- 1036 i. Recall II.B.3. through II.B.3.d.: [synchronicity].
- 1037 L. **Evaluation** of a system's objects, attributes, and relationships
 1038 **requires prior specification of values.**
- 1039 1. Recall II.A.2. through II.A.2.d.iv.[III.]: [criteria] and
 1040 recall II.A.7. through II.A.7.e.: [positivist versus normative].
- 1041 2. System viability typically requires both
 1042 *sufficiency* and redundancy.
